

II II II II

# Price Lists Using Data Extraction

# **Price List Data-Extraction**

# Overview

Price Lists can be created and manipulated in many different ways. Some of the common methods are:

- 1. Standard AS/400-based price list printouts
- 2. Price List data files, that can be manipulated by third-party tools
- 3. Price Lists as Excel spreadsheets
- 4. Price Lists in several Dancik-designed Word document formats
- 5. Price Lists as HTML drilldown applications that can be e-mailed

All of these options are available with the Price Lists by Price Class program on the Price Lists menu. Although the standard AS/400-based price lists are summarized by price class (and therefore do not include item-level details), all of the data-extraction options (options 2-5 above) can include item-level details (each item number) as well as summarized data by price class.

The term *data-extraction* is used generically to cover all of the options in which pricing data is manipulated as opposed to simply printed. The extracted price list data can be manipulated in many different ways, some of which are described in this section as part of the Dancik-supplied software. The extracted price list data can be transferred to folders, personal computers, and imported into various third-party programs including Microsoft Access and Excel.

### **Best Practices**

The following is information about how to best use this new feature.

#### **Data-Extraction Files**

- Good housekeeping is important. If you plan to use this feature extensively, be sure to delete any files you are no longer using. These files waste system space, and can eventually slow down performance. If, for example, you generate a data-extraction file to create a quick IFS report, delete the file after the IFS report is complete.
- If you just want to generate Dancik-supplied IFS reports, don't worry about multiple pricing buckets. This feature applies to people using the Spreadsheet feature. Keep it simple, one file per Price List report in bucket 1.
- File and bucket descriptions are key. You can't get much detail in the provided eight-digit file name. So, use the File Description and Bucket Description to provide full descriptions. This helps avoid confusion as to what is in a file or bucket.
- Avoid loading your data-extraction files with unnecessary items. Use the selection criteria on the Price List by Price Class option to narrow your reports. No point in generating a 100-page report for the 50 pages of items your customer really wants.

#### **Generating HTML Price List Drilldowns**

- When generating a data-extraction file for this feature, you don't need to use multiple pricing buckets. We suggest just using bucket 1 (Price List bucket 1 or Customer bucket 1) for every report you generate. This helps you remember which bucket you used and keeps down the size of the data-extraction file.
- Keep the file size, or number of records in the file, small—no more than 1000 records. Too many records make the drilldown file large and difficult to e-mail. Also, all data is loaded dynamically via JavaScript. Some browser will "time out" if JavaScript runs too long.

#### Generating Detail or Summary Price List IFS Reports.

When generating your data-extraction file, you don't need to use multiple pricing buckets. We suggest using bucket 1 (Price List bucket 1 or Customer bucket 1) for every report you generate. This helps you remember which bucket you used and keeps down the size of the data-extraction file.

#### **Generating Spreadsheets**

When generating your data-extraction file for this feature, you might want to use multiple pricing buckets for external data manipulation. You'll need to remember which buckets you used when appending a record to an existing data-extraction file.

If you're going to use multiple buckets, we suggest selecting the same manufacturers for each bucket. For example, if you choose Mfgr REX for bucket 1, then choose Mfgr REX, for bucket 2. If you select different manufacturers, your data-extraction file will become extremely large and contain obsolete pricing bucket comparisons. Remember, this feature is primarily for people who want to extract data and generate their own reports and analysis.

### **Price Lists By Price Class**

The Price List by Price Class feature includes an option that lets you extract the data used in the creation of a price list, and place that data into various file formats.

#### To extract price list data

6. From the Price List Menu, enter option 4 - Price Lists Summarized By Price Class (Figure 1).

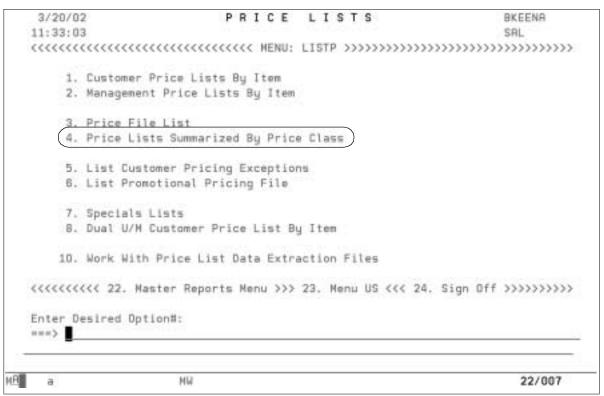

Figure 1: Price Lists menu with Price Lists by Price Class option circled

Figure 2: Price Lists Menu on RPL menu

After you enter option **4** on one of the screens shown in Figure 1 or Figure 2, a screen appears with three options (Figure 3). *Important: The data-extraction option is only valid for options 1 and 2*.

AS/400 USER OPTIONS --- PRINT PRICE LISTS SUMMARIZED BY PRICE CLASS ---Enter "1" to Print For Specific Customer Account#s. Enter "2" to Print For & Price List#. Enter "3" to Print For Groups Of Customers, By Parameter Selection. Enter one of the choices listed above: F4=Cancel MB a NW 15/044

Figure 3: Print Price List print options

*Note:* When you enter option 1 on the above screen, you are prompted to enter the account numbers for the accounts for which you want to run the price list. When you enter option 2, you are prompted to enter a specific price list number such as LP, A1, or A2.

7. Versions 1 and 4 prompt the Data Extraction field to appear on the Price List Print Options - 1 screen (Figure 5).

```
Enter "1" for Regular Customer Version (80-120 Column Format).
Enter "2" for Extended Customer Version (132 Column, Shows ProgramHs).
Enter "3" for Management Version (132 Column, Shows Cost, GP%, PgmHs).
Enter "4" for Customer Rolled Goods Version (Roll/Cut & Whse/Direct).
Enter one of the choices listed above: 
F4=Cancel
F1=Return To Previous Screen
```

Figure 4: Version Selection Screen

8. After this screen, proceed through the next few screens and options, until you come to the Price List Print Options screen. Here you will find the option, **Extract results to data-file for later use** (Figure 5).

| Bucket Description                                                                   | Enter a brief description of the selected bucket of prices. These buckets contain the first three unit of measure conversions that you have created for the item. This will help later when you manipulate the file using various Dancik-supplied and/or third-party programs.                                                                                                                                     |
| Enter Warehouse, or<br>leave blank to access<br>Stock vs. Non-Stock at<br>ltem Level | If you enter a warehouse, that warehouse is used to extract the Item<br>Stock flag from the SKU file (ITEMSTK). If you leave the <b>warehouse</b><br>field blank, then the Stock flag is pulled from the ITEM file. (See Item<br>File <b>Inventory</b> field)                                                                                                                                                      |

 Table 10-1: Fields in the Price List Print Options Screen Continued

*Note:* The maximum number of price list data sets is nine per file—six price lists numbers plus three sets of customer-specific pricing.

After all Data-Extract options have been loaded, and your report has run, you should have a file in library <u>DOD@DTAEXT</u> with the name you assigned on the screen shown in Figure 6.

10. You can now move this file from the AS/400 to personal computers, and manipulate the file using spreadsheets, third-party software, and the Dancik-supplied options described later in this document.

Figure 7 is a flow chart showing the process of creating a data-extraction file from the Price List by Price Class

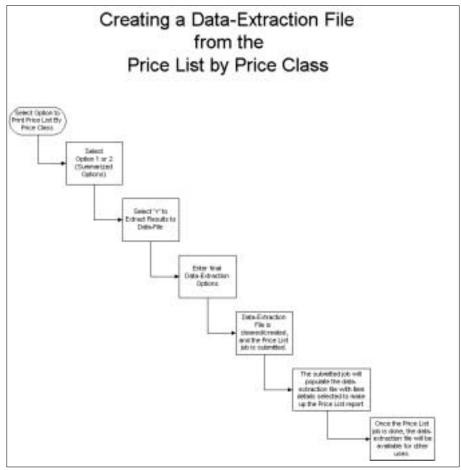

Figure 7: Creating a data-extraction file from the Price List by Price Class

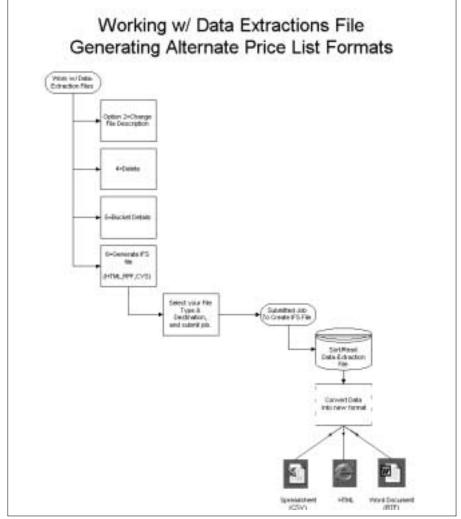

Figure 8 is a flow chart showing the process of working with data-extraction files.

Figure 8: Working with data-extraction files

### **Working With Data-Extraction Files**

After the data-extraction file (DEF) has been created and populated by the Price Lists by Price File, you can work with the DEF using the Work With Data-Extraction Files program. This program is a part of Dancik's Output Distribution System (ODS). Most of the features of this program require that certain hardware infrastructure is in place. Depending on the feature, this infrastructure might include networked connections between personal computers and your AS/400, an operational AS/400 web server and/or an operational AS/400 e-mail server.

The Work With Data-Extraction Files program includes options for manipulating the data supplied in DEFs and generating Word documents, spreadsheets, and even HTML drilldown applications.

#### To work with price list data extraction files

1. On the Dancik menu system, from menu RPL, enter option **10**, or from ODS enter option **30**. A screen appears showing the category of data-extraction file. At this time, the Price List by Price Class DEF is only option available (Figure 9).

Figure 10: Price List Bucket Detail screen

Figure 10 shows the descriptions of the pricing buckets. Each DEF can contain up to six price list buckets, and up to three customer price buckets. Each bucket represents a price for each item. For simple price lists, you probably have only one bucket filled in. However, you can create files (and then spreadsheets and other output) with multiple prices for each item.

#### Price List Data-Extraction

If you select option **6–Generate IFS Files** the screen shown in Figure 11 appears. IFS stands for Integrated File System, which is part of the AS/400 operating system.

```

| Include Comments                            | This field tells the program whether or not to include the Price Class comments in the report.                                                                                                                                                        |
| Report Title/Heading                        | This will be the heading/title loaded to your report in the Header area.                                                                                                                                                                              |
| Price List Pricing<br>-OR- Customer Pricing | Select one of the two entry fields to tell the program where to pull the pricing from to load into the report.                                                                                                                                        |
| Packaging Bucket                            | Select one of the three packaging buckets to be loaded into the report.                                                                                                                                                                               |
| New File Name                               | This is the name of your new .RTF file.Note:You do not need to enter a file extension, such as RTF, as the<br>program enters an extension for you.                                                                                                    |
| Destination Folder                          | This is where your new file will be stored in the IFS.                                                                                                                                                                                                |

Table 10-7: Entry Fields for Summary Price List Report Screen

## **ODS Options for Data-Extraction**

All of the data-extraction features have been integrated with the Dancik-supplied Output Distribution System (ODS).

The new options for the ODS Setup Menu are:

- Option 30 Work w/ Data-Extraction Files
- Option 31 E-Mail IFS File

Table 10-16 shows the **Work w/Data Extraction Files** option on the ODS Setup menu.

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

Figure 16: ODS Setup menu with Work w/Data Extraction Files option circled

Note: Options 30 and 31 are also available from menu ODS in the Dancik Menu System.

**Option 30. Work with Data-Extraction Files** – Refer to "Working With Data-Extraction Files" on page 11. This is the same option that appears on the Price Lists Menu.

**Option 31. E-Mail IFS File** – Authorized users can send e-mail with an IFS file attached, to up to 25 addresses. This feature requires that a suitable Internet infrastructure be in place. Figure 17 shows the **E-Mail IFS File** option on the Output Distribution Setup Menu.

Figure 19: IFS Lookup Window

Table 10-10 describes the options on the IFS Lookup Window.

| Options | Description                                                                                                               |
|---------|---------------------------------------------------------------------------------------------------------------------------|
|         | You can only use this option on Type *DIR entries. It lets you advance to view all sub-entries of the selected directory. |
|         | This option lets you to select a *STMF(Stream File) and bring it back to the original calling program.                    |

Table 10-10: Options on the IFS Lookup Window

### What is the IFS?

The IFS (integrated file system) is a part of OS/400 that supports stream input/output and storage management, similar to personal computer and UNIX operating systems, while providing an integrating structure over all information stored in the AS/400.

The key features of the integrated file system are:

- Support for storing information in stream files that can contain long continuous strings of data. These strings of data might be, for example, the text of a document or the picture elements in a picture. The stream file support is designed for efficient use in client/server applications.
- A hierarchical directory structure that lets you organize objects like fruit on the branches of a tree. Specifying the path through the directories to an object accesses the object.

- A common interface that lets users and applications access, not only the stream files, but also database files, documents, and other objects that are stored in the AS/400.
- A common view of stream files that are stored locally on the AS/400. Stream files can also be stored remotely on a Local Area Network (LAN) server, a Novell NetWare server, another remote AS/400, or a Network File System server.

#### File Layout of the Price List Data-Extraction File

The fields shown in Table 10-11 include most of the values that can print on the regular Price Lists by Price Class. However, this file contains all of the items included within each of the price classes, along with many other fields that do not print on the standard Price Lists by Price Class. Therefore, you have far more flexibility using this file, than you do with the standard printing options. Additionally, the file lets you store up to six sets of prices by price list, and up to three sets of prices for specific account numbers.

| Field Name       | Description             |
|------------------|-------------------------|
